RABBIT

A grass-eating mammal that lives in meadows and field edges.

1 What can it see, hear, or feel?

Long ears swivel toward sounds, wide-set eyes watch all around, and a sniffing nose checks for danger.

2 Where does it live — and why?

It lives in meadows and woodland edges, with soft soil to dig a tunnel system called a warren.

3 How does it send messages?

It thumps its back feet hard to warn others, and a flash of white tail tells rabbits to run.

4 What does it do when something changes?

When something changes, it freezes, then bolts in a zigzag toward the nearest cover.

5 How does it learn?

Young rabbits watch their mother and older rabbits to learn safe feeding spots and alarm signals.

6 How does it have babies?

A mother has five or six blind, hairless babies in a hidden nest, and visits them at night.

7 What are its limits?

Open ground with no cover forces it to stay near its burrow, ready to sprint for safety.

8 What does this teach us?

A calm rabbit is still watching and smelling everything — sensing trouble before it arrives.

LOOK AT THE ANIMAL:

What do you see it doing right now?

What a living thing can sense becomes its reality.
Environment shapes design.
