BLACK-AND-WHITE RUFFED LEMUR

Varecia variegata

1. What can it see, hear, or feel?
It uses sharp eyes, strong ears, and a keen nose to find ripe fruit and sense danger nearby.

2. Where does it live — and why?
It lives high in Madagascar's rainforest trees, where fruit is plentiful and predators cannot reach it.

3. How does it send messages?
It uses loud barking calls to warn the group of danger and to keep family members in contact.

4. What does it do when something changes?
When something changes, it may freeze and watch, or leap quickly to a safer branch above.

5. How does it learn?
Young lemurs learn by watching older ones and copying how they find food and avoid danger.

6. How does it have babies?
Mothers build nests in the trees, and babies depend on the group for food and protection.

7. What are its limits?
It needs tall rainforest trees and quiet space. Without its forest, it cannot survive.

8. What does this teach us?
Every animal survives based on what its senses can reach and what its environment provides.

WHY IS THIS ANIMAL HERE?

Black and white ruffed lemurs live only in Madagascar's eastern rainforests.

Their forests are being cleared for farms, charcoal, and roads.

They depend on big old trees that take decades to replace.

When its habitat shrinks:

- ripe fruit becomes rare and seasonal
- family groups lose the tall trees they nest in
- they become one of the most endangered mammals on Earth

This place is not their natural home, but it can help keep the species alive.

LIFE Park helps care for part of one of the largest lemur populations in the United States.

THINK ABOUT THIS

If loud calls told your family where you were, what would your call sound like?

What a living thing can sense becomes its reality.
Environment shapes design.
